

TRINETRA

Threat Reasoning Intelligence Network for Exploit Tracking & Response Architecture

Approach Abstract — Terrier Cyber Quest 2026

TRINETRA is an AI-powered multi-agent cybersecurity platform designed to discover, correlate, explain and prioritize attack chains against agentic AI systems in a controlled simulated environment.

Core USP

From “What is vulnerable?” to “How can it become mission compromise?”

Methodology

Reconnaissance → Attack Generation → Findings → Attack Graph → Multi-Agent AI Reasoning → Mission Risk → Mitigation → Reporting

Technology

Python • LangGraph • LangChain • Ollama • PyRIT • Neo4j • NetworkX • FastAPI • React • Docker • MITRE ATLAS • OWASP LLM Top 10

Controlled Environment

The proof of concept is intended for authorized testing against simulated systems using synthetic or dummy data. It is not intended for real government infrastructure, live production systems, or unauthorized targets.
